

TBX-Core Dialect Definition

Core: Core

Additional Required Module(s): -

Namespace: urn:iso:std:iso:30042:ed:3.0

Use TermComp module: False

Description:

TBX-Core is a dialect which uses only the Core module. Unlike other dialects, it looks the same in both "DCA" and "DCT" styles. However, like the DCA styles of the other dialects, TBX-Core uses an integrated RNG schema, a modified version of the Core module RNG which disallows inclusion of any data categories which are not explicitly defined in the Core module.
